Coding & Solution

This section evaluates the quality and completeness of your implemented code and the overall solution. Your submission should demonstrate working functionality, clean code practices, and alignment with your defined requirements.

Instructions:

1. Ensure your code is well-structured, commented, and follows best practices for your chosen technology stack.
2. The solution should address the core problem statement and implement the key functional requirements.
3. Include all source files, configuration files, and setup instructions needed to run the application.
4. Attach or link to your code repository (e.g., GitHub) in the table below.

Solution Summary

Field	Details
Repository Link / URL	Not provided. Declarative Salesforce project configured directly in the Salesforce org (no external source repository).
Programming Language(s)	Salesforce declarative configuration (point-and-click); formula language for validation rules and formula fields
Framework(s) Used	Salesforce Lightning Platform: Lightning Experience, Flow Builder, Reports and Dashboards
Key Features Implemented	• Custom objects: Farm, Crop, Farmer and Buyer for data entry and record management • Relationships linking Farmer, Farm, Crop and Buyer records • Validation rules and formula fields for farm/crop data validation and calculated values • Flows (automation) for crop updates and buyer notifications • Reports for farm, crop, farmer and buyer analysis • Lightning dashboards for productivity, sales and operational monitoring • Salesforce access controls to help prevent invalid data and unauthorised access
Pending / Incomplete Features	No pending features identified in the project document. All planned features are implemented.
Setup / Run Instructions	1. Log in to the Salesforce org where the project is configured. 2. Open the App Launcher and select the Farm Management application. 3. Create records in this order: Farmer, Farm, Crop, Buyer. 4. Validation rules and flows run automatically when records are saved. 5. Open the Reports and Dashboards tabs to view farm, crop, farmer and buyer analysis.

Code Quality Checklist

S.No	Criteria	Status (Yes / No)
1	Code is modular and organized into functions / classes	Yes
2	Meaningful variable and function names are used	Yes
3	Code includes comments / documentation where necessary	Partial
4	Error handling is implemented for critical operations	Yes
5	The application runs without critical errors	Yes
6	Code is committed to a version control repository	No

Additional Notes / Comments:

Built declaratively on Salesforce, so there is little traditional source code. Detailed configuration steps are documented, but inline code-level comments are limited (hence Partial for comments). The solution covers Farm, Crop, Farmer and Buyer management with validation, automation, reports and dashboards. No external version control repository is used; the configuration lives in the Salesforce org.
